I am Joe Lee, a software developer with 3 years of experience at Turing-Drive, dedicated to research and implement path planning, system integration, and GNSS positioning. My coding skills include C++, C, and Python. I have implemented the algorithms on buses and golf carts.

Skills

Languages: C/C++, Python, Shell scrip
Frameworks: ROS, ROS2
OS: Linux, Window
Developer Tools: Git, Docker, VS Code, Vim, Cmake,
Libraries: Eigen, Opencv, Pandas, NumPy, Matplotlib
Hardware: NVIDIA Jetson, Raspberry Pi, Arduino

Education

National Yunlin University of Science and Technology

Yunlin, Taiwan

Department of Electrical Engineering

Sep. 2017 – Jun 2019

- LiDAR Pedestrian Detection and Trajectory Tracking Based on Morphological Extended-Jump-Distance Clustering Segmentation and Its Intelligent Patrolling Security Robot Application

National Formosa University

Yunlin, Taiwan

Department of Electrical Engineering

Sep. 2015 – Jun 2017

Professional Experience

Turing Drive Inc(C++/C, Python, ROS, Shell, Linux, Path Planning, GNSS)

Taipei, Taiwan

Software Engineer

Nov 2019 – Present

- **Motion Planning Algorithms:** Understood motion planning algorithms and tuned parameters and including trajectory smoothing, generating kinematically-feasible and collision-free trajectories, vehicle cruising and obstacle avoidance
- **Motion Velocity Optimization Algorithms:** Participated in designing and implementing a motion velocity optimization algorithm with objective function and constraints to generate velocity profile
- **Upgrade and System Integration:** Upgraded the autonomous driving system to ROS2 and integrated different information from various modules into system management, including state machine, error monitor and system interface. Understood the workflow of the autonomous driving system
- **Open Planner Module:** A 6-meter autonomous driving bus is put to service in residential area and bus lane, on open road with mixed traffic flow. Traffic light status is calibrated and perception module and integrated to the system, total mileage exceeds 5,000 km, and over 4,000 people have been onboard
 - * Designed and implemented a logger system for the open planner, which records trajectory and control information and creates visualizations. This reduced on-site debugging and parameter tuning time by 50%
 - * Understood open local planner and including trajectory generator, evaluator, predictor and parameters, Since the functions used by generator and evaluation are too repetitive, they have been refactored and optimized. This resulted in a 60% increase in execution speed
 - * Participated in designing and implementing of the Automatic Emergency Braking(AEB) and Adaptive Cruise Control(ACC) functions, which generate safe braking distances based on time-to-collision(TTC)
- **GNSS:** Setted up RTK infrastructure and designed and implemented GNSS communication parser, currently operating in various experimental sites

Selected Projects & Awards

Smart trash can(C++/C, ROS, Navigation Stack, SLAM, Opencv, PCL)

Sep 2017 – May 2019

- **Award:** Applied to autonomous patrol security robots. It won a Silver Medal at the Korean Invention Awards and also achieved good results in domestic software competitions
- **System Integration:** Integrated the SLAM module, Navigation Stack module, and leg tracking module into the robot system using ROS.
- **Leg Tracking:** Researched and implemented point cloud clustering and geometric features of point clouds, Used Adaboost to implement leg detection and achieved pedestrian tracking through Kalman filtering. The detection performance is excellent in open spaces.
